TIPS TO REMEMBER ABOUT LAMBPLAN EBVs:

- 1 For most commercial operations, BETTER GROWTH is vital. Rams must have +ve EBVs for weight
- 2 The importance of Fat and Muscle EBVs depends on how the lambs will be sold and at what weight:
- for trade lambs sold in sale yards, Fat and Muscle not so important
- for heavier lambs sold via Value-based Marketing (contracts, grids etc), Fat and Muscle are very important
- 3 Indexes are a guide - you must help the buyer or talk to your ram supplier to get the right EBVs
- 4 Every 1kg EBV for weight is worth 0.25 - 0.33kg extra carcase weight
- \$125 - \$150 extra over the life of a ram
- 5 The 3T's - teeth, testicles and toes
- rams must have sounds mouths, 2-functional firm testicles and 4 clean, strong feet and legs

TRAITS THAT DEFINE THE VALUE TERMINAL SIREs

The skill in selecting terminal sires for lamb production is to identify those sires that have desirable genes that produce lambs with high growth rate, low fat (lean) and better carcase conformation. At present, we cannot directly measure the genes of an animal. LAMBPLAN can however provide an estimate of the value of a sires genes by looking at his own performance for certain traits and that of his relatives. This estimate is called an Estimate Breeding Value (EBV). For terminal sires there are three main traits to concentrate on, these being

- 1 Post weaning weight (PWWT) - describe the animals genetic merit growth rate. A positive EBV means the animals progeny will be genetically faster growing. That is they reach market weight at an earlier age.
- 2 Post weaning fat (PFAT) - describe the value of each animal's genes for fat depth at constant weight - a negative EBV means that an animals progeny will be a genetically leaner animal
- 3 Post weaning eye muscle depth (PEMD) - describe the value of each animal's genes for eye muscle depth at constant weight - a positive EBV means a genetically thicker-muscled animal, and one that will have slightly more of its lean tissue in higher-priced cuts.
